Department of Bio-Science

Topic- Atomic Structure
Semester- II (Minor)
Subject- Chemistry
Presented by- Dr. Bijeta Mitra

ELEMENTS and COMPOUNDS

- ▶ Pure substances which cannot be split into simple components through chemical process are called as elements.
- ▶ Substances formed by the combination of two or more elements through chemical reactions are called as compounds.

Atoms and molecules

- ▶ Atoms are the smallest particle which shows all the characteristic properties of an element.
- ▶ Molecules are the smallest particles which can exist independently.

Types of molecules

Monoatomic	Diatomic	Polyatomic
Molecules with only one atom. e.g. He , Ne	Molecules with two atoms. e.g. H ₂ , Cl ₂ , O ₂	Molecules with more than two atoms. e.g. S ₈ , P ₄

Elements : a substance consisting of atoms which all have the same number of protons.

Substance : is matter which has a specific composition and specific properties.

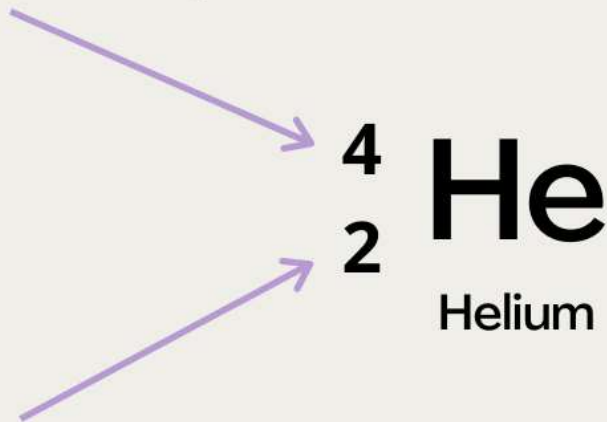

Particle	Relative Mass	Relative Charge	Charge / C	Mass / kg
Protons	1	+ 1	+ 1.6×10^{-19}	1.67×10^{-27}
Neutrons	1	neutral	0	1.67×10^{-27}
Electrons	0.0005	- 1	- 1.6×10^{-19}	9.11×10^{-31}

Atomic number and Mass number

ATOMIC NUMBER VS MASS NUMBER

Mass number is the number of protons plus neutrons

Atomic number is the number of protons

$$14 - 6 = 8$$

Atomic Mass — 14

Atomic Number — 6

Neutron Number — 8

Isotopes

- ▶ Atoms of a chemical element with the same atomic number and position in the periodic table and nearly identical chemical behavior but with different atomic masses and physical properties.

Hydrogen (H)

AND TWO OF ITS ISOTOPES.

Carbon-12		Carbon-13		Carbon-14	
12	6 protons	13	6 protons	14	6 protons
C	6 neutrons	C	7 neutrons	C	8 neutrons
6	6 electrons	6	6 electrons	6	6 electrons

Isobars and Isotones

- ▶ Isobars– Atoms having same mass number but different atomic numbers.

- ▶ Isotones– Atoms having same numbers of neutrons.

Oxygen ${}^{16}_8\text{O}$ ($p=8; n=8$)

Nitrogen ${}^{15}_7\text{N}$ ($p=7; n=8$)

Carbon ${}^{14}_6\text{C}$ ($p=6; n=8$)

Isotopes, Isobars and Isotones :

${}_1\text{H}^1$, ${}_1\text{H}^2$ and ${}_1\text{H}^3$ \Rightarrow Isotopes

Same = Atomic number

Different = atomic mass

${}_{18}\text{Ar}^{40}$, ${}_{19}\text{K}^{40}$ and ${}_{20}\text{Ca}^{40}$ \Rightarrow Isobars

Isotones \leftarrow ${}_6\text{C}^{14}$, ${}_7\text{N}^{15}$ and ${}_8\text{O}^{16}$

Same = Atomic mass

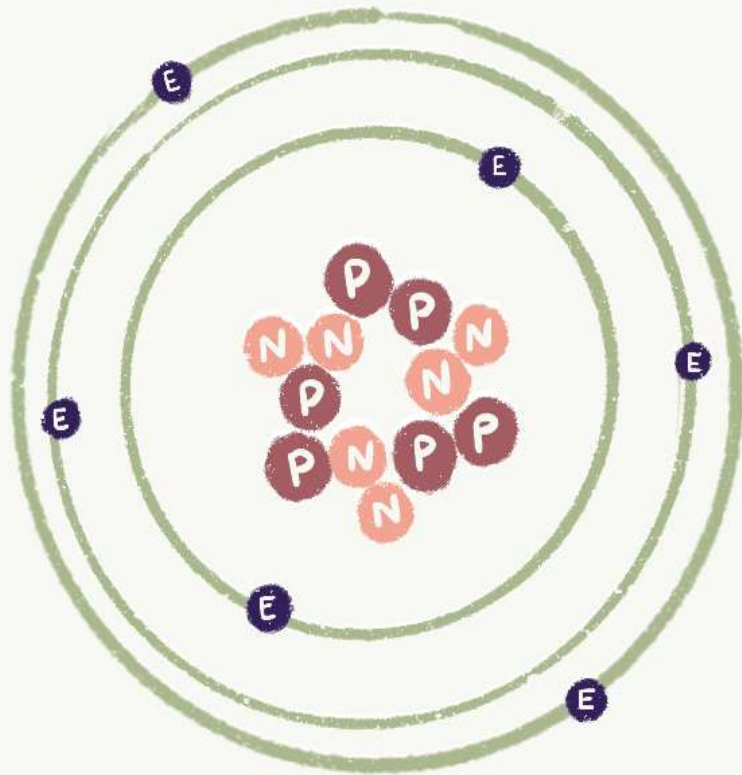

Different = Atomic number

Same = Number of neutrons

Different = Atomic number and mass

Atomic Weight vs. Atomic Mass

Atomic mass is the sum of protons and neutrons of a single atom.

Carbon-6 Atom
Atomic Mass = 12

Atomic weight is the weighted average of the atomic mass of all natural isotopes of an element.

Carbon
Atomic Weight = 12.0107

$$\text{Atomic Weight} = \frac{\text{Weight of one atom of an element}}{\text{Weight of one atom of hydrogen}}$$

$$= \frac{\text{Weight of one atom of an element}}{\frac{1}{12} \text{ weight of one atom of carbon}}$$

Atomic Mass & Gram-Atomic Mass

- Examples:

<u>Element</u>	<u>Atomic mass</u>	<u>Gram-atomic mass</u>
Carbon	12.01 <i>u</i>	12.01 g/mol
Oxygen	16.00 <i>u</i>	16.00 g/mol
Aluminum	26.98 <i>u</i>	26.98 g/mol
Silicon	28.09 <i>u</i>	28.09 g/mol
Gold	197.0 <i>u</i>	197.0 g/mol

Molecular Weight (MW)

The sum of the atomic weights of all the atoms in a molecule of the substance.

Molar Mass of Element:

HCl (hydrochloric acid)

$$\text{H} \rightarrow 1.007 \text{ g/mol} \times 1$$

$$\text{Cl} \rightarrow 35.453 \text{ g/mol} \times 1$$

$\text{C}_6\text{H}_{12}\text{O}_6$ (Glucose)

$$\text{C}_6 \rightarrow 12.0107 \text{ g/mol} \times 6 = \underline{72.0642}$$

$$\text{H}_{12} \rightarrow 1.007 \text{ g/mol} \times 12 = \underline{12.084}$$

$$\text{O}_6 \rightarrow 15.9994 \text{ g/mol} \times 6 = \underline{95.9964}$$

wikiHow to Calculate Molar Mass

Molar Mass of Compound:

HCl (hydrochloric acid)

$$= 1.007 \text{ g/mol} + 35.453 \text{ g/mol}$$

$$= \boxed{36.460 \text{ g/mol}}$$

$\text{C}_6\text{H}_{12}\text{O}_6$ (Glucose)

$$= 72.0642 + 12.084 + 95.9964$$

$$= \boxed{180.1446 \text{ g/mol}}$$

Gram Molecular Weight

Molecular Weight expressed in grams is called gram molecular Weight.

Eg. Molecular weight of Carbon Monoxide (CO) is 28 hence it's gram Molecular Weight is 28 g.

It is also called “one mole molecule” which refers to Avogadro's number of molecule.

Avogadro's law

Equal volumes of all gases under identical conditions of temperature and pressure contain equal number of molecules

**Avogadro's
Number**

6.023×10^{23}

Empirical vs Molecular Formula

Empirical

Simplest whole number
ratio of elements

Molecular
